WIKTORIA SZITENHELM

SOFTWARE & AI ENGINEER | CUSTOMER INTEGRATIONS & PRODUCTION SYSTEMS

wiktoria.szitenhelm@gmail.com | +48 694 596 082 | Portfolio | LinkedIn | GitHub

PROFILE

Software and AI engineer with production experience at J.P. Morgan and a track record of independently shipping full-stack applications, AI workflows, and third-party integrations. Experienced in translating stakeholder requirements into working implementations, building reliable flows with validation and guardrails, and monitoring production systems. Hands-on with TypeScript, Python, REST APIs, webhooks, n8n, LLMs, RAG, and cloud infrastructure. Native Polish and fluent English.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Java, SQL, Rust, Solidity

AI and automation: LLM prompting, tool use, guardrails, failure handling, RAG, embeddings, semantic search, Gemini API, Anthropic API, n8n

Backend and integrations: REST APIs, webhooks, Next.js, Spring Boot, Prisma, PostgreSQL, MySQL, Supabase

Cloud and observability: AWS, CloudWatch, Vercel, Docker, Terraform, CI/CD, GitHub Actions, Grafana

Frontend: React, Redux

EXPERIENCE

Independent Software & AI Engineer | Independent Jan 2026 - Present

- Built an accounting automation tool for family-run e-commerce businesses that reconciles bank transactions against marketplace sales, saving approximately 50 hours of manual work per month.
- Delivered a WordPress website for a client, implementing third-party integrations for newsletter subscriptions, an events calendar, and an online shop with PayU payment processing.
- Founded and independently developed WellKey, a B2B employee wellbeing platform, owning product development, engineering, fundraising, and go-to-market activities.
- Gathered requirements from 20+ HR leaders and conducted 12+ structured discovery interviews, translating findings into an MVP with anonymous employee check-ins, AI-assisted chat with crisis-language safety guardrails, and an aggregated employer dashboard with role-based access control.
- Secured a $22K grant and deployed WellKey solo using Vercel and Supabase (PostgreSQL and Realtime).

XSwap | Smart Contract Engineer (Rust / Solidity) May 2025 - Oct 2025

- Broke down a complex cross-chain flow (EVM <-> Solana token and messaging infrastructure via Chainlink CCIP) into a robust on-ramp/off-ramp implementation: instruction handling, account management, and message decoding in Rust, validated end-to-end via JavaScript simulation scripts.
- Applied security-first design across the flow, including input validation, state control, and failure handling; documented code and communicated technical pain points to the team.

J.P. Morgan | Software Engineer | Glasgow, UK Jun 2023 - Jun 2024

- Developed a production financial application used daily by internal teams during migration from Sybase/PowerBuilder to Java, Spring Boot, React, and AWS Aurora PostgreSQL.
- Gathered requirements through calls with internal users and translated them into implementation plans; owned React/Redux and Java/Spring functionality for reference-data screens, CRUD operations, and Liquibase-managed schema migrations.
- Handled dual-write transactions across legacy and modern databases with different ID-generation strategies using a chained transaction manager.
- Monitored production health through AWS CloudWatch logs and metrics, contributed to resilience testing before go-live, and supported deployment via ServiceNow.

SELECTED TECHNICAL PROJECTS

home4u, real-estate listings and AI search | Next.js, TypeScript, Prisma, MySQL, Gemini, Grafana

- Built a full ingestion pipeline: marketplace crawling, normalization, quality checks, deduplication (union-find and scored matching), and a clean public API.
- Implemented semantic search with embeddings and Gemini-powered natural-language queries converted into validated structured filters; the core application remains usable without AI.
- Added Zod validation at trust boundaries, tests for high-risk processing logic, structured AI-call logging, a Grafana dashboard for run history, success rates, and latency, and GitHub Actions listing-freshness checks.

Gift Suggestion Agent | n8n, Ollama, RAG, webhooks, vector search

- Built a webhook-triggered, local-first RAG pipeline that retrieves relevant personal context using embeddings and vector search, then generates grounded suggestions through a locally hosted LLM without sending data off the machine.

HACKATHONS AND AWARDS

Built and presented working prototypes at international hackathons, translating complex technical solutions for non-technical judges and audiences.

ZKHack Berlin 2025, ZKPassport bounty winner | Solo build

- Built a privacy-preserving anonymous form submission workflow; the concept later evolved into WellKey.

ETHWarsaw 2025, Base bounty winner | Team project

- Co-built a peer-to-peer tutor-matching Solidity dApp with on-chain coordination and wallet-signature authentication.

ETHGlobal Cannes 2026, ZenAgent | Solo build

- Independently built an end-to-end application under a hackathon deadline, integrating World ID, 0G Storage, ENS, and the Anthropic API.
- Combined identity verification, encrypted data storage, and AI-generated insights into a working demo.

EDUCATION AND LANGUAGES

University of Aberdeen | 2020 - 2025
Master's Degree in Computing Science with Spanish, First Class Honours
Teaching Assistant (2021 - 2023): Python programming workshops and technical mentoring.

Languages: Polish (native), English (fluent), Spanish (intermediate)
